Some moisture from a low over the northern Arabian Sea may be drawn northeastward into southern Pakistan around midweek. This moisture could fuel showers and storms in the area. A trough can lead to scattered rain over far northern Pakistan early to middle part of the week, while much of India remains dry. A trough can lead to a few showers in northern Pakistan next week and some modeling suggests a tropical feature impacting Pakistan and Afghanistan later next week. Forecasting a tropical feature that far out is very tricky so I left the forecast dry as more than half of the models look dry across southern Pakistan. In any event, much of India will be dry next week.
